Abstract. Let k be a field, G an abelian group with a bicharacter, A a colour algebra; i.e., an associative graded k -algebra with identity, \mathcal{C} a graded A -coring that is projective as a right A -module, \mathcal{C}^* the graded dual ring of \mathcal{C} and Λ a left graded \mathcal{C} -comodule that is finitely generated as a graded right \mathcal{C}^* -module. We give necessary and sufficient conditions for projectivity and flatness of a graded module over the colour endomorphism ring ${}^{\mathcal{C}}END(\Lambda)$.

0. Introduction

The notion of graded corings (except graded algebras and graded coalgebras) rarely appears in the literature on corings. The only paper we know where this notion appears is [8]. In the present paper we will give some conditions to test projectivity or flatness over the colour endomorphism ring of a finitely generated graded \mathcal{C} -comodule, where \mathcal{C} is a graded coring. Let k be a field, A a k -algebra, \mathcal{C} an A -coring, ${}^*\mathcal{C}$ the left dual ring of \mathcal{C} and Λ a right \mathcal{C} -comodule that is finitely generated as a left ${}^*\mathcal{C}$ -module. In [11], we gave necessary and sufficient conditions for projectivity and flatness over the endomorphism ring $End^{\mathcal{C}}(\Lambda)$ of Λ . In the present paper, we will extend these results to a G -graded A -coring \mathcal{C} , where G is an abelian group with a bicharacter and A is a colour algebra; i.e., a graded associative k -algebra with identity. More precisely, let us denote by $\mathcal{C}^* = HOM_A(\mathcal{C}_A, A_A)$ the largest graded vector space contained in $Hom_A(\mathcal{C}_A, A_A)$. It has a colour algebra structure. Let Λ be a graded left \mathcal{C} -comodule that is finitely generated as a

graded right \mathcal{C}^* -module. We give necessary and sufficient conditions for projectivity and flatness over the colour endomorphism ring ${}^{\mathcal{C}}\text{END}(\Lambda)$ of Λ . The presence of the bicharacter makes the difference with the classical gradation. These results are interesting when $\mathcal{C} = A$, or when \mathcal{C} contains a grouplike element, or when \mathcal{C} comes from a graded entwining structure with respect to a bicharacter. If $\mathcal{C} = A$ then ${}^{gr-A}\mathcal{M}$ is the category of graded left A -modules and A^* is isomorphic to the opposite algebra A^{op} of A . If \mathcal{C} contains a grouplike element X , then A is a graded left \mathcal{C} -comodule that is finitely generated as a graded right \mathcal{C}^* -module. In this case, ${}^{\mathcal{C}}\text{END}(A)$ is the colour subring of (\mathcal{C}, X) -coinvariants of A . Our techniques and methods are inspired from [10], [7] and [11].

1. Preliminary results

Throughout the paper, k is a field, G is an abelian group and $(./.)$ is a bicharacter on G ; i.e., a map from $G \times G$ into k^\times satisfying:

$$(x/y) = (y/x)^{-1} \quad \text{and} \quad (x/y + z) = (x/y)(x/z).$$

These two relations imply that $(x + y/z) = (x/z)(y/z)$. If M and N are vector spaces $\text{Hom}(M, N)$ is the vector space of k -linear maps from M to N .

A vector space A is G -graded or graded if $A = \bigoplus_{x \in G} A_x$, where the A_x are vector subspaces of A . An algebra A (not necessarily associative with identity) is said to be graded if A is a graded vector space as above and the A_x satisfy $A_x A_y \subseteq A_{x+y}$. According to [8, Section 1], a colour algebra is an associative graded algebra. In what follows we assume that all colour algebras are unital. We will consider k as a colour algebra with the trivial gradation. Given colour algebras A and B , a morphism of colour algebras $A \rightarrow B$ is a morphism of algebras which is homogeneous of degree 0. Let m be an element of a graded vector space M . If m is homogeneous, we denote by $|m|$ its degree. If $|m|$ occurs in some expression, this means that we regard m as a homogeneous element and that the expression extends to the other elements by linearity. Let M and N be graded vector spaces. An element of $\text{Hom}(M, N)$ is homogeneous of degree x if $f(M_y) \subseteq N_{x+y}$ for all $y \in G$. We denote by $\text{HOM}(M, N)_x$ the vector subspace of $\text{Hom}(M, N)$ whose elements are homogeneous of degree x and we will set $\text{HOM}(M, N) = \bigoplus_{x \in G} \text{HOM}(M, N)_x$. Clearly, $\text{HOM}(M, N)$ is the largest graded vector space contained in $\text{Hom}(M, N)$. The space $\text{HOM}(M, N)$ is denoted $\text{Hom}_k(M, N)_G$ in [9]. By [13, Corollary 1.2.11], $\text{HOM}(M, N) = \text{Hom}(M, N)$ if G is finite or if M is finite-dimensional. By [9], $\text{HOM}(M, M)$ is a colour algebra. If M, N, M' and N' are graded vector spaces and if $f : M \rightarrow M'$ and $g : N \rightarrow N'$ are homogeneous linear maps then $(f \otimes g)(m \otimes n) = (|g|/|m|)f(m) \otimes g(n)$. We will denote by ${}^{gr-k}\mathcal{M}$ the category of graded k -vector spaces. The morphisms of ${}^{gr-k}\mathcal{M}$ are the homogeneous k -linear maps of degree 0; we call them the graded k -linear maps. Let N be a graded vector space. For every x in G , the x -suspension of N is the graded vector space $N(x)$ obtained from N by a shift of the gradation by x . As vector spaces, N and $N(x)$ coincide but the gradations are related by $N(x)_y = N_{x+y}$ for all $y \in G$.

Let A be a colour algebra. A left A -module M is called a graded left A -module if M admits a decomposition as a direct sum of vector spaces $M = \bigoplus_{x \in G} M_x$ such that $A_x M_y \subseteq M_{x+y}$; $\forall x, y \in G$.

Definition 1.1. *Let M, N be graded left A -modules. A homogeneous element f of $\text{Hom}(M, N)$ is colour left A -linear if $f(am) = (|f|/|a|)af(m)$ for all $a \in A$.*

If M, N are graded left A -modules, we let ${}_A\text{HOM}(M, N)_x$ denote the vector subspace of $\text{Hom}(M, N)$ whose elements are colour A -linear of degree x . So the colour left A -linear maps of degree 0 are exactly the left A -linear maps of degree 0; i.e., ${}_A\text{HOM}(M, N)_0 = {}_A\text{Hom}(M, N) \cap \text{HOM}(M, N)_0$. We define ${}_A\text{HOM}(M, N)$ to be the sum of these subspaces; the sum is direct: ${}_A\text{HOM}(M, N) = \bigoplus_{x \in G} {}_A\text{HOM}(M, N)_x$. We call ${}_A\text{HOM}(M, N)$ the subspace of colour left A -linear maps of $\text{Hom}(M, N)$. Contrary to the classical gradation, if $A \neq k$ and if the bicharacter is not trivial, there is no comparison relation between ${}_A\text{HOM}(M, N)$ and ${}_A\text{Hom}(M, N)$ even if M is finitely generated as an A -module or if G is finite. If $G = \mathbb{Z}/2\mathbb{Z}$, colour A -linear maps are called A -superlinear in [16]. We will denote by ${}_{gr-A}\mathcal{M}$ the category of graded left A -modules. The morphisms of ${}_{gr-A}\mathcal{M}$ are the colour left A -linear maps of degree 0; we call them the graded left A -linear maps. It is well known that ${}_{gr-A}\mathcal{M}$ is a Grothendieck category. We can define in a similar way a graded right A -module and a graded A -bimodule. A colour right A -linear map of degree x is just a homogeneous right A -linear map of degree x . To establish our main results we will need the following well-known results of graded ring theory.

- If N is a graded left (right) A -module, $N(x)$ is a graded left (right) A -module which coincides with N as a graded left (right) A -module.
- An object of ${}_{gr-A}\mathcal{M}$ is projective (resp. flat) in ${}_{gr-A}\mathcal{M}$ if and only if it is projective (resp. flat) in ${}_A\mathcal{M}$, the category of left A -modules.
- An object of ${}_{gr-A}\mathcal{M}$ is free in ${}_{gr-A}\mathcal{M}$ if it has an A -basis consisting of homogeneous elements or equivalently, if it is isomorphic to some $\bigoplus_{i \in I} A(x_i)$, where $(x_i, i \in I)$ is a family of elements of G .
- An object of ${}_{gr-A}\mathcal{M}$ is called finitely generated if it is a quotient of a free graded module of finite rank $\bigoplus_{i \leq m} A(x_i)$, where the $x_i \in G$ and m is a natural integer.
- Any object of ${}_{gr-A}\mathcal{M}$ is a quotient of a free object in ${}_{gr-A}\mathcal{M}$, and any projective object in ${}_{gr-A}\mathcal{M}$ is isomorphic in ${}_{gr-A}\mathcal{M}$ to a direct summand of a free object.
- An object of ${}_{gr-A}\mathcal{M}$ is flat in ${}_{gr-A}\mathcal{M}$ if and only if it is the inductive limit of finitely generated free objects in ${}_{gr-A}\mathcal{M}$.
- An object Λ of ${}_{gr-A}\mathcal{M}$ is called finitely presented if there is an exact sequence $\bigoplus_{i \leq m} A(x_i) \rightarrow \bigoplus_{j \leq n} A(y_j) \rightarrow \Lambda \rightarrow 0$ for $x_i, y_j \in G$ and some natural integers m and n . A finitely presented graded module is finitely generated.

Lemma 1.2. *Let A be a colour algebra and M a graded left A -module which is generated as A -module by a homogeneous element m of degree 0. Then M is finitely generated as a graded left A -module.*

Proof. We have $M = Am$. The k -linear map $f : A \rightarrow M$; $a \mapsto am$ is surjective, homogeneous of degree 0 and left A -linear. So f is an epimorphism in ${}_{gr-A}\mathcal{M}$. \square

An A -coring \mathcal{C} is an A -bimodule together with two A -bimodule maps $\Delta_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C} \otimes_A \mathcal{C}$ and $\epsilon_{\mathcal{C}} : \mathcal{C} \rightarrow A$ such that the usual coassociativity and counit properties hold. Let \mathcal{C} be an A -coring. A left \mathcal{C} -comodule is a left A -module M together with a left A -linear map $\rho_{M,\mathcal{C}} : M \rightarrow \mathcal{C} \otimes_A M$ such that

$$(\epsilon_{\mathcal{C}} \otimes_A id_M) \circ \rho_{M,\mathcal{C}} = id_M, \quad \text{and} \quad (\Delta_{\mathcal{C}} \otimes_A id_M) \circ \rho_{M,\mathcal{C}} = (id_{\mathcal{C}} \otimes_A \rho_{M,\mathcal{C}}) \circ \rho_{M,\mathcal{C}}.$$

For more details on corings, we refer to [1], [2], [3], [4] and [5].

An A -coring \mathcal{C} is called a graded A -coring if \mathcal{C} admits a decomposition as a direct sum of vector spaces $\mathcal{C} = \bigoplus_x \mathcal{C}_x$ such that \mathcal{C} is a graded A -bimodule, and $\Delta_{\mathcal{C}}$ and $\epsilon_{\mathcal{C}}$ are graded left and right A -linear maps. Note that $\epsilon_{\mathcal{C}}(c) = 0$ if c is homogeneous of degree $|c| \neq 0$. We use the notation-type of Sweedler-Heyneman for $\Delta_{\mathcal{C}}$ but we will omit the parentheses on subscripts. So for every homogeneous element $c \in \mathcal{C}$ we will write $\Delta_{\mathcal{C}}(c) = \sum_{|c|} c_1 \otimes_A c_2$; where $\sum_{|c|} = \sum_{|c_1|+|c_2|=|c|}$. We have $\sum_{|c|} \sum_{|c_1|} c_{11} \otimes_A c_{12} \otimes_A c_2 = \sum_{|c|} \sum_{|c_2|} c_1 \otimes_A c_{21} \otimes_A c_{22}$. Note that $\epsilon_{\mathcal{C}}(c) = 0$ if $|c| \neq 0$. A left \mathcal{C} -comodule M is called a graded left \mathcal{C} -comodule if M admits a decomposition as a direct sum of vector spaces $M = \bigoplus_x M_x$ such that $\rho_{M,\mathcal{C}}$ is homogeneous of degree 0; i.e., $\rho_{M,\mathcal{C}}$ is a graded left A -linear map. We will write $\rho_{M,\mathcal{C}}(m) = \sum_{|m|} m_{(-1)} \otimes_A m_{(0)}$, where $\sum_{|m|} = \sum_{|m_{(-1)}|+|m_{(0)}|=|m|}$.

Any colour algebra A is a graded A -coring called the trivial A -coring, and a graded k -coalgebra is a graded k -coring. A morphism of graded left \mathcal{C} -comodules $f : M \rightarrow N$ is a morphism in ${}_{gr-A}\mathcal{M}$ such that

$$\rho_{N,\mathcal{C}} \circ f = (id_{\mathcal{C}} \otimes_A f) \circ \rho_{M,\mathcal{C}}, \quad \text{that is}$$

$$\sum_{|m|} f(m)_{(-1)} \otimes_A f(m)_{(0)} = \sum_{|m|} m_{(-1)} \otimes_A f(m_{(0)}) \quad \forall m \in M.$$

A morphism of graded left \mathcal{C} -comodule will be called a graded left \mathcal{C} -colinear map. We denote by ${}^{gr-\mathcal{C}}\mathcal{M}$ the category of graded left \mathcal{C} -comodules. The morphisms of ${}^{gr-\mathcal{C}}\mathcal{M}$ are the graded left \mathcal{C} -colinear maps. The category ${}^{gr-\mathcal{C}}\mathcal{M}$ has direct sums. If \mathcal{C} is projective as a right A -module, then ${}^{gr-\mathcal{C}}\mathcal{M}$ is a Grothendieck category ([4] for the ungraded case).

Definition 1.3. Let \mathcal{C} be a graded A -coring and M, N be objects of ${}^{gr-\mathcal{C}}\mathcal{M}$. A homogeneous element $f \in Hom(M, N)$ is colour left \mathcal{C} -colinear if f is colour left A -linear and $\rho_{N,\mathcal{C}} \circ f = (id_{\mathcal{C}} \otimes_A f) \circ \rho_{M,\mathcal{C}}$.

It follows from Definition 1.3 that a graded left \mathcal{C} -colinear map is a colour left \mathcal{C} -colinear map of degree 0. If M and N are objects of ${}^{gr-\mathcal{C}}\mathcal{M}$ and $x \in G$, we will denote by ${}^c HOM(M, N)_x$ the vector subspace of $Hom(M, N)$ whose elements are colour left \mathcal{C} -colinear of degree x . So we have

$${}^c HOM(M, N)_x = \{f \in {}_A HOM(M, N)_x, \sum_{|m|} f(m)_{(-1)} \otimes_A f(m)_{(0)} =$$

$$\sum_{|m|} (|f|, |m_{(-1)}|) m_{(-1)} \otimes_A f(m_{(0)})$$

We will set ${}^{\mathcal{C}}\text{HOM}(M, N) = \bigoplus_{x \in G} {}^{\mathcal{C}}\text{HOM}(M, N)_x$. We call ${}^{\mathcal{C}}\text{HOM}(M, N)$ the subspace of colour left \mathcal{C} -colinear maps of $\text{Hom}(M, N)$. We can define in a similar way a graded right \mathcal{C} -comodule. A homogeneous colour right \mathcal{C} -colinear map is just a homogeneous right \mathcal{C} -colinear.

If N is a graded left \mathcal{C} -comodule, then for every x in G , the x -suspension $N(x)$ is a graded left \mathcal{C} -comodule which coincides with N as a \mathcal{C} -comodule. By [17], the linear map $i_{-x} : N \rightarrow N(x)$ defined by $i_{-x}(n) = (-x/|n|)n$ is bijective and homogeneous of degree $-x$. It is obviously colour left \mathcal{C} -colinear.

Lemma 1.4. *Let \mathcal{C} be a graded A -coring, and M, N be graded left \mathcal{C} -comodules. For every $x \in G$, the linear map ${}^{\mathcal{C}}\text{HOM}(M, N)_x \rightarrow {}^{\mathcal{C}}\text{HOM}(M, N(x))_0$; $f \mapsto i_{-x} \circ f$, where i_{-x} is defined above is an isomorphism of vector spaces.*

Lemma 1.5. *Let P be an object of ${}^{gr-\mathcal{C}}\mathcal{M}$. Then the functor ${}^{\mathcal{C}}\text{HOM}(P, -) : {}^{gr-\mathcal{C}}\mathcal{M} \rightarrow {}_{gr-k}\mathcal{M}$ is left exact.*

Proof. Let $0 \rightarrow L \rightarrow M \rightarrow N \rightarrow 0$ be an exact sequence in ${}^{gr-\mathcal{C}}\mathcal{M}$; so $0 \rightarrow L(x) \rightarrow M(x) \rightarrow N(x) \rightarrow 0$ is exact in ${}^{gr-\mathcal{C}}\mathcal{M}$ for every $x \in G$. By [13, Corollary 1.2.2], P is projective in ${}_{gr-k}\mathcal{M}$. So the sequence

$$0 \rightarrow \text{HOM}(P, L(x))_0 \rightarrow \text{HOM}(P, M(x))_0 \rightarrow \text{HOM}(P, N(x))_0 \rightarrow 0$$

is exact for every $x \in G$. It follows from Lemma 1.4 that

$$0 \rightarrow \text{HOM}(P, L)_x \rightarrow \text{HOM}(P, M)_x \rightarrow \text{HOM}(P, N)_x \rightarrow 0$$

is an exact sequence for every $x \in G$. We know that $i \circ f \in {}^{\mathcal{C}}\text{HOM}(P, M)_x$ for all $f \in {}^{\mathcal{C}}\text{HOM}(P, L)_x$. This means that the sequence

$$0 \rightarrow {}^{\mathcal{C}}\text{HOM}(P, L)_x \rightarrow {}^{\mathcal{C}}\text{HOM}(P, M)_x \rightarrow {}^{\mathcal{C}}\text{HOM}(P, N)_x$$

is exact for every $x \in G$; i.e.,

$$0 \rightarrow {}^{\mathcal{C}}\text{HOM}(P, L) \rightarrow {}^{\mathcal{C}}\text{HOM}(P, M) \rightarrow {}^{\mathcal{C}}\text{HOM}(P, N)$$

is an exact sequence. So the functor ${}^{\mathcal{C}}\text{HOM}(P, -)$ is left exact. □

We say that an object P of ${}^{gr-\mathcal{C}}\mathcal{M}$ is projective if the functor ${}^{\mathcal{C}}\text{HOM}(P, -)_0$ is exact.

Lemma 1.6. *Let \mathcal{C} be a graded A -coring. An object P of ${}^{gr-\mathcal{C}}\mathcal{M}$ is projective in ${}^{gr-\mathcal{C}}\mathcal{M}$ if and only if the functor ${}^{\mathcal{C}}\text{HOM}(P, -)$ is exact.*

Proof. Assume that ${}^{\mathcal{C}}\text{HOM}(P, -)$ is exact in ${}^{gr-\mathcal{C}}\mathcal{M}$. Let $0 \rightarrow L \rightarrow M \rightarrow N \rightarrow 0$ be an exact sequence in ${}^{gr-\mathcal{C}}\mathcal{M}$. So the sequence $0 \rightarrow {}^{\mathcal{C}}\text{HOM}(P, L) \rightarrow {}^{\mathcal{C}}\text{HOM}(P, M) \rightarrow {}^{\mathcal{C}}\text{HOM}(P, N) \rightarrow 0$ is exact. It follows that the sequence $0 \rightarrow {}^{\mathcal{C}}\text{HOM}(P, L)_0 \rightarrow {}^{\mathcal{C}}\text{HOM}(P, M)_0 \rightarrow {}^{\mathcal{C}}\text{HOM}(P, N)_0 \rightarrow 0$ is exact. This means

that P is a projective object in ${}^{gr-C}\mathcal{M}$. Assume that P is projective in ${}^{gr-C}\mathcal{M}$. Let $0 \rightarrow L \rightarrow M \rightarrow N \rightarrow 0$ be an exact sequence in ${}^{gr-C}\mathcal{M}$. Clearly, $0 \rightarrow L(x) \rightarrow M(x) \rightarrow N(x) \rightarrow 0$ is an exact sequence in ${}^{gr-C}\mathcal{M}$ for every $x \in G$. By the projectivity of P , the sequence

$$0 \rightarrow {}^cHOM(P, L(x))_0 \rightarrow {}^cHOM(P, M(x))_0 \rightarrow {}^cHOM(P, N(x))_0 \rightarrow 0$$

is exact for every $x \in G$. Using Lemma 1.4, we get that the sequence $0 \rightarrow {}^cHOM(P, L) \rightarrow {}^cHOM(P, M) \rightarrow {}^cHOM(P, N) \rightarrow 0$ is exact. \square

Let us consider A as a graded right A -module. By [13], $HOM_A(\mathcal{C}_A, A_A) = \bigoplus_x HOM_A(\mathcal{C}_A, A_A)_x$ is a graded vector space: it is the largest graded vector space contained in $Hom_A(\mathcal{C}_A, A_A)$. We write $\mathcal{C}_x^* = HOM_A(\mathcal{C}_A, A_A)_x$ and $\mathcal{C}^* = HOM_A(\mathcal{C}_A, A_A)$. Then \mathcal{C}^* is a colour algebra called the graded right dual ring of \mathcal{C} (see [5, 17.8] for the ungraded case): the multiplication is defined by $f\#g = (|f|, |g|)g \circ (f \otimes_A id_{\mathcal{C}}) \circ \Delta_{\mathcal{C}}$; i.e., $f\#g(c) = \sum_{|c|} (|f|, |g|)g(f(c_1)c_2)$ for all colour right A -linear maps $f, g: \mathcal{C} \rightarrow A$ and homogeneous element $c \in \mathcal{C}$; where $\Delta_{\mathcal{C}}(c) = \sum_{|c|} c_1 \otimes_A c_2$. The unit of \mathcal{C}^* is $\epsilon_{\mathcal{C}}$ and there is a morphism of colour algebras $i: A^{op} \rightarrow \mathcal{C}^*$ defined by $i(a)(c) = (|a|, |c|)\epsilon_{\mathcal{C}}(c)a$. We will denote by \mathcal{M}_{gr-C^*} the category of graded right \mathcal{C}^* -modules. Any graded left \mathcal{C} -comodule M is a graded right \mathcal{C}^* -module: the action is defined by $m.f = \sum_{|m|} (|m_{(-1)}|, |f|)f(m_{(-1)})m_{(0)}$. If \mathcal{C} is projective as a right A -module, then ${}^{gr-C}\mathcal{M}$ is a full subcategory of \mathcal{M}_{gr-C^*} ; i.e., ${}^cHOM(M, N) = HOM_{\mathcal{C}^*}(M, N)$ for any $M, N \in {}^{gr-C}\mathcal{M}$. As a consequence, an object of ${}^{gr-C}\mathcal{M}$ that is projective in \mathcal{M}_{gr-C^*} is projective in ${}^{gr-C}\mathcal{M}$. Another consequence is that if M and N are objects of ${}^{gr-C}\mathcal{M}$ with M finitely generated as a right \mathcal{C}^* -module, then ${}^cHOM(M, N) = HOM_{\mathcal{C}^*}(M, N) = Hom_{\mathcal{C}^*}(M, N)$.

Given two graded left \mathcal{C} -comodules Λ and N , the graded vector space ${}^cHOM(\Lambda, N)$ is a graded left module over the colour endomorphism ring $B = {}^cEND(\Lambda)$ of Λ : the action is given by $bf = (|b|, |f|)(f \circ b); \forall f \in {}^cHOM(\Lambda, N), b \in B$. This defines a functor $F' = {}^cHOM(\Lambda, -) : {}^{gr-C}\mathcal{M} \rightarrow {}^{gr-B}\mathcal{M}$. Let us consider Λ as a graded right B -module by $\lambda.b = (|\lambda|/|b|)b(\lambda)$. So Λ is a graded (A, B) -bimodule. For any $P \in {}^{gr-B}\mathcal{M}$, $\Lambda \otimes_B P$ is a graded left \mathcal{C} -comodule with the coaction $\rho_{P, \mathcal{C}} = \rho_{\Lambda, \mathcal{C}} \otimes_B id_P$.

Lemma 1.7. *Let Λ and N be graded left \mathcal{C} -comodules and P be a graded left B -module. For every $x \in G$, the canonical linear map*

$$\phi : {}^cHOM(\Lambda \otimes_B P, N)_x \rightarrow {}_B HOM(P, {}^cHOM(\Lambda, N))_x$$

defined by $\phi(f)(p)(\lambda) = (|p|, |\lambda|)f(\lambda \otimes_B p)$ is an isomorphism.

Proof. The inverse of ϕ is defined by $\psi(g)(\lambda \otimes_B p) = (|\lambda|, |p|)g(p)(\lambda)$. \square

We deduce from Lemma 1.7 that ${}^cHOM(\Lambda \otimes_B P, N)_0 \simeq {}_B HOM(P, {}^cHOM(\Lambda, N))_0$, and this means that the functor F' has the left adjoint $F = \Lambda \otimes_B - : {}^{gr-B}\mathcal{M} \rightarrow {}^{gr-C}\mathcal{M}$. The unit of the adjunction is given by the graded k -linear map

$$u_N : N \rightarrow {}^cHOM(\Lambda, \Lambda \otimes_B N), n \mapsto [\lambda \mapsto (|n|, |\lambda|)(\lambda \otimes n)]$$

for $N \in {}_{gr-B}\mathcal{M}$, while the counit is given by the graded k -linear map (the evaluation map)

$$c_M : \Lambda \otimes_B {}^c\text{HOM}(\Lambda, M) \rightarrow M; \lambda \otimes f \mapsto (|\lambda|, |f|)f(\lambda)$$

for $M \in {}^{gr-C}\mathcal{M}$. The adjointness property means that we have

$$F'(c_M) \circ u_{F'(M)} = id_{F'(M)}, \quad c_{F(N)} \circ F(u_N) = id_{F(N)}; \quad M \in {}^{gr-C}\mathcal{M}, \quad N \in {}_{gr-B}\mathcal{M}. \quad (\star)$$

2. The main results

Let A be a colour algebra and \mathcal{C} a graded A -coring. We keep the notations of the preceding sections.

Lemma 2.1. *Let Λ and N be graded left \mathcal{C} -comodules. Set $B = {}^c\text{END}(\Lambda)$. For every $x \in G$, we have*

- (1) ${}^c\text{HOM}(\Lambda, N(x)) = {}^c\text{HOM}(\Lambda, N)(x)$
- (2) $\Lambda \otimes_B B(x) = \Lambda(x)$.

An object $\Lambda \in {}^{gr-C}\mathcal{M}$ is called semi-quasiprojective if the functor ${}^c\text{HOM}(\Lambda, -) : {}^{gr-C}\mathcal{M} \rightarrow {}_{gr-k}\mathcal{M}$ sends an exact sequence of the form $\bigoplus_I \Lambda(x_i) \rightarrow \bigoplus_J \Lambda(x_j) \rightarrow N \rightarrow 0$ to an exact sequence (see [15]). A projective object in ${}^{gr-C}\mathcal{M}$ is semi-quasiprojective in ${}^{gr-C}\mathcal{M}$.

Lemma 2.2. *Assume that \mathcal{C} is projective as a right A -module. Let Λ be a graded left \mathcal{C} -comodule and set $B = {}^c\text{END}(\Lambda)$. Then the functor ${}^c\text{HOM}(\Lambda, -)$ commutes with*

- (1) direct sums if Λ is finitely generated as a graded right \mathcal{C}^* -module,
- (2) direct limits if Λ is finitely presented as a graded right \mathcal{C}^* -module.

Proof. (2) We know that ${}^{gr-C}\mathcal{M}$ is a Grothendieck category so the functor ${}^c\text{HOM}(\Lambda, -)_0$ preserves direct limits. We also know from Lemma 1.4 that $\text{HOM}_{\mathcal{C}^*}(\Lambda, N)_x = \text{HOM}_{\mathcal{C}^*}(\Lambda, N(x))_0$ for every $x \in G$. Let $(N_i)_{i \in I}$ be a directed system of right graded \mathcal{C}^* -modules. It is easy to show that $(\varinjlim N_i)(x) = \varinjlim (N_i(x))$ for every $x \in G$. Now the result follows from the fact direct limit commutes with direct sum. \square

Lemma 2.3. *Assume that \mathcal{C} is projective as a right A -module. Let Λ be a graded left \mathcal{C} -comodule that is finitely generated as a graded right \mathcal{C}^* -module, and let $B = {}^c\text{END}(\Lambda)$. For every index set I ,*

- (1) $c_{\bigoplus_I \Lambda(x_i)}$ is an isomorphism for every $x_i \in G$;
- (2) $u_{\bigoplus_I B(x_i)}$ is an isomorphism for every $x_i \in G$;
- (3) if Λ is semi-quasiprojective in ${}^{gr-C}\mathcal{M}$, then u is a natural isomorphism; in other words, the induction functor $F = \Lambda \otimes_B (-)$ is fully faithful.

Proof. (1) By Lemma 2.1(1), ${}^cHOM(\Lambda, \Lambda)(x_i) = {}^cHOM(\Lambda, \Lambda(x_i))$ for every $i \in I$. This implies that $\oplus_I B(x_i) = \oplus_I {}^cHOM(\Lambda, \Lambda(x_i))$. By Lemma 2.2(1), the natural map $\kappa : \oplus_I B(x_i) \rightarrow {}^cHOM(\Lambda, \oplus_I \Lambda(x_i))$ is an isomorphism. Lemma 2.1(2) implies that $\Lambda \otimes_B (\oplus_I B(x_i)) \simeq \oplus_I \Lambda(x_i)$. It is easy to see that this isomorphism is just $c_{\oplus_I \Lambda(x_i)} \circ (id_\Lambda \otimes \kappa)$. So $c_{\oplus_I \Lambda(x_i)}$ is an isomorphism since κ is an isomorphism.

(2) Putting $M = \oplus_I \Lambda(x_i)$ in (\star) and using (1), we find

$${}^cHOM(\Lambda, c_{\oplus_I \Lambda(x_i)}) \circ uc_{HOM(\Lambda, \oplus_I \Lambda(x_i))} = id_{c_{HOM(\Lambda, \oplus_I \Lambda(x_i))}}; i.e.,$$

$${}^cHOM(\Lambda, c_{\oplus_I \Lambda(x_i)}) \circ u_{\oplus_I B(x_i)} = id_{\oplus_I B(x_i)}.$$

From (1), ${}^cHOM(\Lambda, c_{\oplus_I \Lambda(x_i)})$ is an isomorphism, hence $u_{\oplus_I B(x_i)}$ is an isomorphism.

(3) Take a graded free resolution $\oplus_J B(x_j) \rightarrow \oplus_I B(x_i) \rightarrow N \rightarrow 0$ of a graded left B -module N . Since u is natural, we have a commutative diagram

$$\begin{array}{ccccccc} \oplus_J \mathbf{B}(\mathbf{x}_j) & \longrightarrow & \oplus_I \mathbf{B}(\mathbf{x}_i) & \longrightarrow & \mathbf{N} & \longrightarrow & 0 \\ u_{\oplus_J B(x_j)} \downarrow & & u_{\oplus_I B(x_i)} \downarrow & & u_N \downarrow & & \\ \mathbf{F}'\mathbf{F}(\oplus_J \mathbf{B}(\mathbf{x}_j)) & \longrightarrow & \mathbf{F}'\mathbf{F}(\oplus_I \mathbf{B}(\mathbf{x}_i)) & \longrightarrow & \mathbf{F}'\mathbf{F}(\mathbf{N}) & \longrightarrow & 0. \end{array}$$

The top row is exact; the bottom row is exact, since

$$F'F(\oplus_I B(x_i)) = {}^cHOM(\Lambda, \Lambda \otimes_B \oplus_I B(x_i)) = {}^cHOM(\Lambda, \oplus_I \Lambda(x_i))$$

and Λ is semi-quasiprojective. By (2), $u_{\oplus_I B(x_i)}$ and $u_{\oplus_J B(x_j)}$ are isomorphisms; and it follows from the five lemma that u_N is an isomorphism. \square

We can now give equivalent conditions for the projectivity and flatness of $P \in {}_{gr-B}\mathcal{M}$.

Theorem 2.4. *Assume that \mathcal{C} is projective as a right A -module. Let Λ be a graded left \mathcal{C} -comodule that is finitely generated as a graded right \mathcal{C}^* -module, and let $B = {}^cEND(\Lambda)$. For $P \in {}_{gr-B}\mathcal{M}$, we consider the following statements.*

- (1) $\Lambda \otimes_B P$ is projective in ${}^{gr-C}\mathcal{M}$ and u_P is injective;
- (2) P is projective as a graded left B -module;
- (3) $\Lambda \otimes_B P$ is a direct summand in ${}^{gr-C}\mathcal{M}$ of some $\oplus_I \Lambda(x_i)$, and u_P is bijective;
- (4) there exists $Q \in {}^{gr-C}\mathcal{M}$ such that Q is a direct summand of some $\oplus_I \Lambda(x_i)$, and $P \cong {}^cHOM(\Lambda, Q)$ in ${}_{gr-B}\mathcal{M}$;
- (5) $\Lambda \otimes_B P$ is a direct summand in ${}^{gr-C}\mathcal{M}$ of some $\oplus_I \Lambda(x_i)$.

Then (1) \Rightarrow (2) \Leftrightarrow (3) \Leftrightarrow (4) \Rightarrow (5).

If Λ is semi-quasiprojective in ${}^{gr-C}\mathcal{M}$, then (5) \Rightarrow (3); if Λ is projective in ${}^{gr-C}\mathcal{M}$, then (3) \Rightarrow (1).

Proof. (2) \Rightarrow (3): If P is projective as a graded left B -module, then we can find an index set I and $P' \in {}_{gr-B}\mathcal{M}$ such that $\oplus_I B(x_i) \cong P \oplus P'$. Then obviously

$$\oplus_I \Lambda(x_i) \cong \Lambda \otimes_B (\oplus_I B(x_i)) \cong (\Lambda \otimes_B P) \oplus (\Lambda \otimes_B P').$$

Since u is a natural transformation, we have a commutative diagram:

$$\begin{array}{ccc} \oplus_I \mathbf{B}(\mathbf{x}_i) & \xrightarrow{\cong} & \mathbf{P} \oplus \mathbf{P}' \\ \downarrow u_{\oplus_I B(x_i)} & & \downarrow u_P \oplus u_{P'} \\ {}^c\mathbf{HOM}(\Lambda, \oplus_I \Lambda(\mathbf{x}_i)) & \xrightarrow[\cong]{} & {}^c\mathbf{HOM}(\Lambda, \Lambda \otimes_B \mathbf{P}) \oplus {}^c\mathbf{HOM}(\Lambda, \Lambda \otimes_B \mathbf{P}') \end{array}$$

From the fact that $u_{\oplus_I B(x_i)}$ is an isomorphism, it follows that u_P (and $u_{P'}$) are isomorphisms.

(3) \Rightarrow (4): Take $Q = \Lambda \otimes_B P$.

(4) \Rightarrow (2): Let $f : \oplus_I \Lambda(x_i) \rightarrow Q$ be a split epimorphism in ${}^{gr-C}\mathcal{M}$. Then

$${}^c\mathbf{HOM}(\Lambda, f) : {}^c\mathbf{HOM}(\Lambda, \oplus_I \Lambda(x_i)) \cong \oplus_I B(x_i) \rightarrow {}^c\mathbf{HOM}(\Lambda, Q) \cong P$$

is also split surjective, hence P is projective as a graded left B -module.

(4) \Rightarrow (5): If (4) is true, we know from the proof of (4) \Rightarrow (2) that P is a direct summand of some $\oplus_I B(x_i)$ in ${}_{gr-B}\mathcal{M}$. So $\Lambda \otimes_B P$ is a direct summand of $\oplus_I \Lambda(x_i)$.

(1) \Rightarrow (2): Take an epimorphism $f : \oplus_I B(x_i) \rightarrow P$ in ${}_{gr-B}\mathcal{M}$. Then

$$F(f) = id_\Lambda \otimes_B f : \Lambda \otimes_B (\oplus_I B(x_i)) \cong \oplus_I \Lambda(x_i) \rightarrow \Lambda \otimes_B P$$

is an epimorphism in ${}^{gr-C}\mathcal{M}$, and it splits since $\Lambda \otimes_B P$ is projective in ${}^{gr-C}\mathcal{M}$. Consider the commutative diagram:

$$\begin{array}{ccccc} \oplus_I \mathbf{B}(\mathbf{x}_i) & \xrightarrow{f} & \mathbf{P} & \longrightarrow & 0 \\ \downarrow u_{\oplus_I B(x_i)} & & \downarrow u_P & & \\ {}^c\mathbf{HOM}(\Lambda, \oplus_I \Lambda(\mathbf{x}_i)) & \xrightarrow{F'F(f)} & {}^c\mathbf{HOM}(\Lambda, \Lambda \otimes_B \mathbf{P}) & \longrightarrow & 0. \end{array}$$

The bottom row is split exact, since any functor, in particular, ${}^c\text{HOM}(\Lambda, -)$ preserves split exact sequences. By Lemma 2.3(2), $u_{\oplus_I B(x_i)}$ is an isomorphism. A diagram chasing tells us that u_P is surjective. By assumption, u_P is injective, so u_P is bijective. We deduce that the top row is isomorphic to the bottom row, and therefore splits. Thus P is projective in $\in {}_{gr-B}\mathcal{M}$.

Under the assumption that Λ is semi-quasiprojective in ${}^{gr-C}\mathcal{M}$, (5) \Rightarrow (3) follows from Lemma 2.3(3).

(3) \Rightarrow (1): By (3), $\Lambda \otimes_B P$ is a direct summand of some $\oplus_I \Lambda(x_i)$. If Λ is projective in ${}^{gr-C}\mathcal{M}$, then $\oplus_I \Lambda(x_i)$ is projective in ${}^{gr-C}\mathcal{M}$. So $\Lambda \otimes_B P$ being a direct summand of a projective object of ${}^{gr-C}\mathcal{M}$ is projective in ${}^{gr-C}\mathcal{M}$. \square

Theorem 2.5. *Assume that \mathcal{C} is projective as a right A -module. Let Λ be a graded left \mathcal{C} -comodule that is finitely presented as a graded right \mathcal{C}^* -module, and let $B = {}^c\text{END}(\Lambda)$. For $P \in {}_{gr-B}\mathcal{M}$, the following assertions are equivalent.*

- (1) P is flat as a graded left B -module;
- (2) $\Lambda \otimes_B P = \varinjlim Q_i$, where $Q_i \cong \oplus_{j \leq n_i} B(x_{ij})$ in ${}^{gr-C}\mathcal{M}$ for some positive integer n_i , and u_P is bijective;
- (3) $\Lambda \otimes_B P = \varinjlim Q_i$, where $Q_i \in {}^{gr-C}\mathcal{M}$ is a direct summand of some $\oplus_{j \in I_i} \Lambda(x_{ij})$ in ${}^{gr-C}\mathcal{M}$, and u_P is bijective;
- (4) there exists $Q = \varinjlim Q_i \in {}^{gr-C}\mathcal{M}$, such that $Q_i \cong \oplus_{j \leq n_i} \Lambda(x_{ij})$ for some positive integer n_i and ${}^c\text{HOM}(\Lambda, Q) \cong P$ in ${}_{gr-B}\mathcal{M}$;
- (5) there exists $Q = \varinjlim Q_i \in {}^{gr-C}\mathcal{M}$, such that Q_i is a direct summand of some $\oplus_{j \in I_i} \Lambda(x_{ij})$ in ${}^{gr-C}\mathcal{M}$, and ${}^c\text{HOM}(\Lambda, Q) \cong P$ in ${}_{gr-B}\mathcal{M}$.

If Λ is semi-quasiprojective in ${}^{gr-C}\mathcal{M}$, these conditions are also equivalent to conditions (2) and (3), without the assumption that u_P is bijective.

Proof. (1) \Rightarrow (2): $P = \varinjlim N_i$, with $N_i = \oplus_{j \leq n_i} B(x_{ij})$ for some positive integer n_i . Take $Q_i = \oplus_{j \leq n_i} \Lambda(x_{ij})$, then

$$\varinjlim Q_i \cong \varinjlim (\Lambda \otimes_B N_i) \cong \Lambda \otimes_B \varinjlim N_i \cong \Lambda \otimes_B P.$$

Consider the following commutative diagram:

$$\begin{array}{ccc} \mathbf{P} = \varinjlim \mathbf{N}_i & \xrightarrow{\varinjlim (u_{N_i})} & \varinjlim {}^c\text{HOM}(\Lambda, \Lambda \otimes_B \mathbf{N}_i) \\ \downarrow u_P & & \downarrow f \\ {}^c\text{HOM}(\Lambda, \Lambda \otimes_B (\varinjlim \mathbf{N}_i)) & \xrightarrow[\cong]{} & {}^c\text{HOM}(\Lambda, \varinjlim (\Lambda \otimes_B \mathbf{N}_i)). \end{array}$$

By Lemma 2.3(2), the u_{N_i} are isomorphisms; by Lemma 2.2, the natural homomorphism f is an isomorphism. Hence u_P is an isomorphism.

(2) \Rightarrow (3) and (4) \Rightarrow (5) are obvious.

(2) \Rightarrow (4) and (3) \Rightarrow (5): Put $Q = \Lambda \otimes_B P$. Then $u_P : P \rightarrow {}^c\text{HOM}(\Lambda, \Lambda \otimes_B P)$ is the required isomorphism.

(5) \Rightarrow (1): We have a split exact sequence $0 \rightarrow N_i \rightarrow P_i = \bigoplus_{j \in I_i} \Lambda(x_{ij}) \rightarrow Q_i \rightarrow 0$ in ${}^{gr-C}\mathcal{M}$. Consider the following commutative diagram:

$$\begin{array}{ccccccccc}
 \mathbf{0} & \longrightarrow & \mathbf{FF}'(\mathbf{N}_i) & \longrightarrow & \mathbf{FF}'(\mathbf{P}_i) & \longrightarrow & \mathbf{FF}'(\mathbf{Q}_i) & \longrightarrow & \mathbf{0} \\
 & & \downarrow c_{N_i} & & \downarrow c_{P_i} & & \downarrow c_{Q_i} & & \\
 \mathbf{0} & \longrightarrow & \mathbf{N}_i & \longrightarrow & \mathbf{P}_i & \longrightarrow & \mathbf{Q}_i & \longrightarrow & \mathbf{0}.
 \end{array}$$

We know from Lemma 2.3(1) that c_{P_i} is an isomorphism. Both rows in the diagram are split exact, so it follows that c_{N_i} and c_{Q_i} are also isomorphisms. Next consider the commutative diagram:

$$\begin{array}{ccc}
 \Lambda \otimes_B \varinjlim {}^c\text{HOM}(\Lambda, \mathbf{Q}_i) & \xrightarrow{id_\Lambda \otimes f} & \Lambda \otimes_B {}^c\text{HOM}(\Lambda, \mathbf{Q}) \\
 \uparrow h & & \downarrow c_Q \\
 \varinjlim (\Lambda \otimes_B {}^c\text{HOM}(\Lambda, \mathbf{Q}_i)) & \xrightarrow{\varinjlim c_{Q_i}} & \mathbf{Q}
 \end{array}$$

where h and f are the natural homomorphisms. h is an isomorphism, because $\Lambda \otimes_B (-)$ preserves inductive limits; by Lemma 2.2, f is an isomorphism; and $\varinjlim c_{Q_i}$ is an isomorphism because every c_{Q_i} is an isomorphism. It follows that c_Q is an isomorphism, hence ${}^c\text{HOM}(\Lambda, c_Q)$ is an isomorphism. From (\star) , we get

$${}^c\text{HOM}(\Lambda, c_Q) \circ uc_{\text{HOM}(\Lambda, Q)} = id_{c_{\text{HOM}(\Lambda, Q)}}.$$

It follows that $uc_{\text{HOM}(\Lambda, Q)}$ is also an isomorphism. Since ${}^c\text{HOM}(\Lambda, Q) \cong P$, u_P is an isomorphism. Consider the isomorphisms

$$\begin{aligned}
 P &\cong {}^c\text{HOM}(\Lambda, \Lambda \otimes_B P) \cong {}^c\text{HOM}(\Lambda, \Lambda \otimes_B {}^c\text{HOM}(\Lambda, Q)) \cong \\
 &{}^c\text{HOM}(\Lambda, Q) \cong \varinjlim {}^c\text{HOM}(\Lambda, \mathbf{Q}_i);
 \end{aligned}$$

where the first isomorphism is u_P , the third is ${}^c\text{HOM}(\Lambda, c_Q)$ and the last one is f . It follows from Lemmas 2.1(1) and 2.2 that ${}^c\text{HOM}(\Lambda, P_i) \cong \bigoplus_{j \in I_i} B(x_{ij})$ is projective as a graded left B -module, hence ${}^c\text{HOM}(\Lambda, \mathbf{Q}_i)$ is also projective as a graded left B -module, and we conclude that P is flat in $\in {}^{gr-B}\mathcal{M}$. The final statement is an immediate consequence of Lemma 2.3(3). \square

3. Applications

3.1. \mathcal{C} contains a grouplike element

A grouplike element of \mathcal{C} is an element $X \in \mathcal{C}_0$ such that $\Delta_{\mathcal{C}}(X) = X \otimes_A X$ and $\epsilon_{\mathcal{C}}(X) = 1_A$ (see [14]). If \mathcal{C} contains a grouplike element X , then A is an object of ${}^{gr-\mathcal{C}}\mathcal{M}$: the \mathcal{C} -coaction is defined by $\rho_{A,\mathcal{C}}(a) = aX = aX \otimes_A 1_A; \forall a \in A$. Conversely, if A is an object of ${}^{gr-\mathcal{C}}\mathcal{M}$, then $\rho_{A,\mathcal{C}}(1_A) = X$ is a grouplike element of \mathcal{C} .

Assume that \mathcal{C} contains a grouplike element X . Then A is an object of $\mathcal{M}_{gr-\mathcal{C}^*}$ and $a.\epsilon_{\mathcal{C}} = a$, that is, A is generated as a right \mathcal{C}^* -module by the homogeneous element $\epsilon_{\mathcal{C}}$ of degree 0. Lemma 1.2 implies that A is finitely generated in $\mathcal{M}_{gr-\mathcal{C}^*}$. For any graded left \mathcal{C} -comodule M , we call ${}^{co\mathcal{C},X}M = \{m \in M, \rho_{M,\mathcal{C}}(m) = X \otimes_A m\}$ the vector space of (\mathcal{C}, X) -coinvariants of M . Clearly, ${}^{co\mathcal{C},X}A = \{a \in A, Xa = aX\}$ is a colour subalgebra of A : the colour subalgebra of (\mathcal{C}, X) -coinvariants. For every $f \in {}^{\mathcal{C}}HOM(A, M)$, $f(1) \in {}^{co\mathcal{C},X}M$. The graded k -linear map $f \mapsto f(1)$ establishes an isomorphism ${}^{\mathcal{C}}HOM(A, M) \rightarrow {}^{co\mathcal{C},X}M$ with inverse the graded k -linear map ψ defined by $\psi(m)(a) = (|m|, |a|)am$. We have ${}^{\mathcal{C}}END(A) = {}^{co\mathcal{C},X}A$. Set $B = {}^{co\mathcal{C},X}A$. Then we get from Theorems 2.4 and 2.5 necessary and sufficient conditions for projectivity and flatness over the colour algebra $B = {}^{co\mathcal{C},X}A$.

3.2. A colour algebra as a trivial coring

A colour algebra A is a graded A -bimodule. Let us define $\Delta_A(a) = a \otimes_A 1_A$ and $\epsilon_A(a) = a$. Then A is an A -coring. A graded left A -comodule is just a graded left A -module. The product on A^* is defined by $f\#g(a) = \sum_{|a|} (|f|, |g|)g(f(a)1_A) = \sum_{|a|} (|f|, |g|)g(1_A)(f(a))$. It is easy to show that the algebra A^* is isomorphic to A^{op} , the opposite algebra of A : this isomorphism is defined by $f \mapsto f(1_A)$. For graded left A -modules M and N , we have ${}^A HOM(M, N) = {}_A HOM(M, N)$. Then Theorems 2.4 and 2.5 give necessary and sufficient conditions for projectivity and flatness over $B = {}_A END(\Lambda)$, where Λ is a finitely generated graded left A -module. When the gradation is trivial we recover [11]. In many examples, Λ will be a colour algebra and A will be a graded Λ -ring with a graded left grouplike character.

Definition 3.1. (see [6], Section 2) *Let A and Λ be two colour algebras and $i : \Lambda \rightarrow A$ a graded ring morphism. A graded k -linear map $\chi : A \rightarrow \Lambda$ is called a graded left grouplike character on A if χ is graded left Λ -linear and*

$$\chi(a\chi(a')) = \chi(aa') \quad \text{and} \quad \chi(1_A) = 1_{\Lambda} \quad \forall a, a' \in A.$$

We then say that A is a graded Λ -ring with a graded left grouplike character χ .

Let A be a graded Λ -ring with a graded left grouplike character χ . Then Λ is a graded left A -module: the action is given by $a \rightarrow \lambda = \chi(a\lambda)$. Furthermore, Λ is cyclic as a left A -module, since $\lambda = (\lambda 1_A) \rightarrow 1_{\Lambda}$. But 1_{Λ} is homogeneous of degree 0, so Λ is a finitely generated as a graded left A -module (Lemma 1.2). So

we get necessary and sufficient conditions for projectivity and flatness over the colour endomorphism ring ${}_A\text{END}(\Lambda)$ of Λ .

Now we will give two examples of this situation. There are other examples in the literature.

- Let H be a colour algebra, the colour tensor product $H \otimes H$ is the G -graded vector space $H \otimes H = \bigoplus_{x \in G} (\bigoplus_{y+z=x} H_y \otimes H_z)$ with multiplication $(h \otimes l)(h' \otimes l') = (|l|/|h'|)hh' \otimes ll'$ for homogeneous elements $h, h', l, l' \in H$. By [9, Lemma 3.2], $H \otimes H$ is a colour algebra. A Hopf colour algebra is a colour algebra and a graded coalgebra such that Δ_H and ϵ_H are morphisms of colour algebras and there exists a graded k -linear map $S_H : H \rightarrow H$ (called antipode) such that $(S_H \otimes id_H) \circ \Delta_H = \epsilon_H = (id_H \otimes S_H) \circ \Delta_H$ or equivalently, $\sum_{|h_1|} \epsilon(h_1)h_2 = h = \sum_{|h_1|} h_1\epsilon(h_2)$ and $\sum_{|h_1|} S(h_1)h_2 = \epsilon(h) = \sum_{|h_1|} h_1S(h_2)$.

Let H be a Hopf colour algebra over k with comultiplication Δ_H , counit ϵ_H and antipode S_H . A colour algebra Λ which is a graded left H -module such that $h.(\lambda\lambda') = \sum_{|h_1|} (|h_2|/|\lambda|)(h_1.\lambda)(h_2.\lambda')$ for all $h \in H$ and $\lambda, \lambda' \in \Lambda$ will be called a graded left H -module algebra. We denote by $A = \Lambda \# H$ the associated smash product; i.e., the colour algebra generated by Λ and H whose multiplication is defined by $(\lambda h)(\lambda' h') = \sum_{|h_1|} (|h_2|/|\lambda'|)\lambda(h_1.\lambda')(h_2h')$ (see [12]). A graded vector space M is a graded left A -module if and only if it is a graded left Λ -module and a graded left H -module such that $h.(\lambda m) = \sum_{|h_1|} (|h_2|/|\lambda|)(h_1.\lambda)(h_2m)$. Define a k -linear map $\chi : A \rightarrow \Lambda$ by $\chi(\lambda h) = \epsilon_H(h)\lambda$. Since $\epsilon_H(h) = 0$ for $|h| \neq 0$, χ is homogeneous of degree 0. Clearly, χ is left Λ -linear. It follows that $\Lambda \# H$ is a graded Λ -ring with a graded left grouplike character χ . Note that ${}_{\Lambda \# H}\text{END}(\Lambda)$ is exactly the colour subring of invariants of Λ ; i.e., ${}_{\Lambda \# H}\text{END}(\Lambda) = \{\lambda \in \Lambda; h.\lambda = \epsilon_H(h)\lambda\}$.

- Assume that \mathcal{C} contains a grouplike element X . The linear map $i : A \rightarrow \mathcal{C}^*$ defined by $i(a)(c) = a\epsilon(c)$ is a morphism of colour algebras. Define $\chi : \mathcal{C}^* \rightarrow A$ by $\chi(f) = f(X)$. Then χ is a graded left grouplike character on \mathcal{C}^* . So \mathcal{C}^* is a graded A -ring.

3.3. \mathcal{C} comes from a graded entwining structure

In this section, A is a colour algebra with multiplication μ and unit ι , and C is a graded coalgebra with comultiplication Δ_C and counit ϵ_C . We denote by $\tau : A \otimes C \rightarrow C \otimes A$ the twist map; that is $\tau(a \otimes c) = (|a|/|c|)c \otimes a$. If M is a left (resp. right C -comodule, we write $\rho_{M,C}(m) = m_{-1} \otimes m_0$ (resp. $\rho_{M,C}(m) = m_0 \otimes m_1$). We remind that C is a graded k -coring. Interesting examples of graded corings come from graded entwining structures. We will often refer to [5] for the ungraded case.

- Graded left-left entwined modules.

A graded left-left entwining structure over k is a triple (A, C, ψ) with a graded k -linear map $\psi : A \otimes C \rightarrow C \otimes A$; $a \otimes c \mapsto (|a_\alpha|/|c|)c^\alpha \otimes a_\alpha$ satisfying the following conditions [5, 32.1]:

$$\psi \circ (\mu \otimes id_C) = (id_C \otimes \mu) \circ (\psi \otimes id_A) \circ (id_A \otimes \psi)$$

$$\begin{aligned}
(\Delta_C \otimes id_A) \circ \psi &= (id_C \otimes \psi) \circ (\psi \otimes id_C) \circ (id_A \otimes \Delta_C) \\
(\epsilon_C \otimes id_A) \circ \psi &= id_A \otimes \epsilon_C \\
\psi \circ (id_C \otimes \iota) &= \iota \otimes id_C.
\end{aligned}$$

These relations are respectively equivalent to

$$\begin{aligned}
(|(aa')_\alpha|/|c|)(c^\alpha \otimes (aa')_\alpha) &= (|a'_\alpha|/|c|)(|a_\beta|/|c^\alpha|)(c^{\alpha\beta} \otimes a_\beta a'_\alpha) \\
(|a_\alpha|/|c|)(\Delta_C(c^\alpha) \otimes a_\alpha) &= (|a_\alpha|/|c_1|)(|a_{\alpha\beta}|/|c_2|)(c_1^\alpha \otimes c_2^\beta \otimes a_{\alpha\beta}) \\
(|a_\alpha|/|c|)(\epsilon_C(c^\alpha)a_\alpha) &= a\epsilon_C(c) \\
(|1_\alpha|/|c|)(c^\alpha \otimes 1_\alpha) &= c \otimes 1.
\end{aligned}$$

The map ψ is called a graded entwining map, and A and C are said to be graded entwined by ψ . By [5, 32.1], $\mathcal{C} = C \otimes A$ is a graded A -coring with A -multiplications $a'(c \otimes a)a'' = \psi(a' \otimes c)aa''$, coproduct

$$\Delta_{\mathcal{C}} : C \otimes A \rightarrow C \otimes A \otimes_A C \otimes A \cong C \otimes C \otimes A; \quad c \otimes a \mapsto \Delta_C(c) \otimes a$$

and counit $\epsilon_{\mathcal{C}}(c \otimes a) = \epsilon_C(c)a$.

Let M be a graded left A -module. Then $C \otimes M$ becomes a graded left A -module if we set $a(c \otimes m) = (|a_\alpha|/|c|)c^\alpha \otimes (a_\alpha m)$. We say that a vector space M is a graded left-left (A, C, ψ) -entwined module if M is a graded left A -module and a graded left C -comodule such that $\rho_{M,C}$ is a graded left A -linear map; i.e.,

$$\rho_{M,C}(am) = (|a_\alpha|/|(m_{-1})|)(m_{-1})^\alpha \otimes (a_\alpha m_0).$$

We denote by ${}_{gr-A}^{gr-C}\mathcal{M}(\psi)$ the category of graded left-left (A, C, ψ) -entwined modules: its morphisms are the graded left A -linear maps and the graded left C -colinear maps. We can show that ${}_{gr-A}^{gr-C}\mathcal{M}(\psi)$ is isomorphic to ${}^{gr-C}\mathcal{M}$.

- Graded right-right entwined modules.

A graded right-right entwining structure over k is a triple (A, C, ψ) with a graded k -linear map $C \otimes A \rightarrow A \otimes C$; $c \otimes a \mapsto (|c|/|a_\alpha|)a_\alpha \otimes c^\alpha$ satisfying the following conditions [5, 32.1]:

$$\begin{aligned}
\psi \circ (id_C \otimes \mu) &= (\mu \otimes id_C) \circ (id_A \otimes \psi) \circ (\psi \otimes id_A) \\
(id_A \otimes \Delta_C) \circ \psi &= (\psi \otimes id_C) \circ (id_C \otimes \psi) \circ (\Delta_C \otimes id_A) \\
(id_A \otimes \epsilon_C) \circ \psi &= \epsilon_C \otimes id_A \\
\psi \circ (id_C \otimes \iota) &= \iota \otimes id_C.
\end{aligned}$$

These relations are respectively equivalent to

$$\begin{aligned}
(|c|/|(aa')_\alpha|)((aa')_\alpha \otimes c^\alpha) &= (|c|/|a_\alpha|)(|c^\alpha|/|a'_\beta|)(a_\alpha a'_\beta \otimes c^{\alpha\beta}) \\
(|c|/|a_\alpha|)(a_\alpha \otimes \Delta_C(c^\alpha)) &= (|(c_2)|/|a_\alpha|)(|(c_1)|/|a_{\alpha\beta}|)(a_{\alpha\beta} \otimes c_1^\beta \otimes c_2^\alpha) \\
(|c|/|a_\alpha|)(a_\alpha \epsilon_C(c^\alpha)) &= \epsilon_C(c)a
\end{aligned}$$

$$(|c|/|1_\alpha|)(1_\alpha \otimes c^\alpha) = 1 \otimes c.$$

By [5, 32.1], $\mathcal{C} = A \otimes C$ is a graded A -coring with A -multiplications $a'(a \otimes c)a'' = a'a\psi(c \otimes a'')$, coproduct

$$\Delta_C : A \otimes C \rightarrow A \otimes C \otimes_A A \otimes C \cong A \otimes C \otimes C; \quad a \otimes c \mapsto a \otimes \Delta_C(c)$$

and counit $\epsilon_C(a \otimes c) = a\epsilon_C(c)$.

Let M be a graded right A -module. Then $M \otimes C$ becomes a graded right A -module if we set $(m \otimes c)a = (|c|/|a_\alpha|)(ma_\alpha) \otimes c^\alpha$. A vector space M is a graded right-right (A, C, ψ) -entwined module if M is a graded right A -module and a graded right C -comodule via such that $\rho_{M,C}$ is a graded right A -linear map; i.e.,

$$\rho_{M,C}(ma) = (|(m_1)|/|a_\alpha|)(m_0a_\alpha) \otimes (m_1)^\alpha.$$

We denote by $\mathcal{M}(\psi)_{gr-A}^{gr-C}$ the category of graded right-right (A, C, ψ) -entwined modules: its morphisms are the graded right A -linear maps and the graded right C -colinear maps. We can show that this category is isomorphic to \mathcal{M}^{gr-C} .

- Graded left-right entwined modules.

A graded left-right entwining structure over k is a triple (A, C, ψ) with a graded k -linear map $A \otimes C \rightarrow A \otimes C$; $a \otimes c \mapsto a_\alpha \otimes c^\alpha$ satisfying the following conditions [5, 32.1]:

$$\begin{aligned} \psi \circ (\mu \otimes id_C) &= (\mu \otimes id_C) \circ (id_A \otimes \tau^{-1}) \circ (\psi \otimes id_A) \circ (id_A \otimes \tau) \circ (id_A \otimes \psi) \\ (id_A \otimes \Delta_C) \circ \psi &= (\tau^{-1} \otimes id_C) \circ (id_C \otimes \psi) \circ (\tau \otimes id_C) \circ (\psi \otimes id_C) \circ (id_A \otimes \Delta_C) \\ (id_A \otimes \epsilon_C) \circ \psi &= id_A \otimes \epsilon_C \\ \psi \circ (\iota \otimes id_C) &= \iota \otimes id_C. \end{aligned}$$

These relations are respectively equivalent to

$$\begin{aligned} (aa')_\alpha \otimes c^\alpha &= (|a'_\alpha|/|c^\alpha|)(|c^{\alpha\beta}|/|a'_\alpha|)(a_\beta a'_\alpha \otimes c^{\alpha\beta}) \\ a_\alpha \otimes \Delta_C(c^\alpha) &= (|a_\alpha|/|c_1^\alpha|)(|c_1^\alpha|/|a_{\alpha\beta}|)(a_{\alpha\beta} \otimes c_1^\alpha \otimes c_2^\beta) \\ a_\alpha \epsilon_C(c^\alpha) &= a\epsilon_C(c) \\ 1_\alpha \otimes c^\alpha &= 1 \otimes c. \end{aligned}$$

Let M be a graded left A -module. Then $M \otimes C$ becomes a graded left A -module if we set $a(m \otimes c) = (|m|/|c|)(|c^\alpha|/|m|)(a_\alpha m \otimes c^\alpha)$. A vector space M is a graded left-right (A, C, ψ) -entwined module if M is a graded left A -module and a graded right C -comodule such that $\rho_{M,C}$ is a graded left A -linear map; i.e.,

$$\rho_{M,C}(am) = (|m_0|/|m_1|)(|(m_1)^\alpha|/|m_0|)(a_\alpha m_0 \otimes (m_1)^\alpha).$$

We denote by ${}_{gr-A}\mathcal{M}(\psi)^{gr-C}$ the category of graded left-right (A, C, ψ) -entwined modules: its morphisms are the graded left A -linear maps and the graded right C -colinear maps.

- Graded right-left entwined modules.

A graded right-left entwining structure over k is a triple (A, C, ψ) with a graded k -linear map $C \otimes A \rightarrow C \otimes A$; $c \otimes a \mapsto c^\alpha \otimes a_\alpha$ satisfying the following conditions [5, 32.1]:

$$\begin{aligned}\psi \circ (id_C \otimes \mu) &= (id_C \otimes \mu) \circ (\tau \otimes id_A) \circ (id_A \otimes \psi) \circ (\tau^{-1} \otimes id_A) \circ (\psi \otimes id_A) \\ (\Delta_C \otimes id_A) \circ \psi &= (id_C \otimes \tau) \circ (\psi \otimes id_C) \circ (id_C \otimes \tau^{-1}) \circ (id_C \otimes \psi) \circ (\Delta_C \otimes id_A) \\ (\epsilon_C \otimes id_A) \circ \psi &= \epsilon_C \otimes id_A \\ \psi \circ (id_C \otimes \iota) &= id_C \otimes \iota\end{aligned}$$

where $\tau : C \otimes A \rightarrow A \otimes C$; $c \otimes a \mapsto (|c|/|a|)a \otimes c$. These relations are respectively equivalent to

$$\begin{aligned}c^\alpha \otimes (aa')_\alpha &= (|c^\alpha|/|a_\alpha|)(|a_\alpha|/|c^{\alpha\beta}|)(c^{\alpha\beta} \otimes a_\alpha a'_\beta) \\ \Delta_C(c^\alpha) \otimes a_\alpha &= (|c_2^\alpha|/|a_\alpha|)(|a_{\alpha\beta}|/|c_2^\alpha|)(c_1^\beta \otimes c_2^\alpha \otimes a_{\alpha\beta}) \\ \epsilon_C(c^\alpha) a_\alpha &= \epsilon_C(c) a \\ c_\alpha \otimes 1^\alpha &= c \otimes 1.\end{aligned}$$

Let M be a graded right A -module. Then $C \otimes M$ becomes a graded right A -module if we set $(c \otimes m)a = (|c|/|m|)(|m|/|c^\alpha|)(c^\alpha \otimes ma_\alpha)$. A vector space M is a graded right-left (A, C, ψ) -entwined module if M is a graded right A -module and a graded left C -comodule such that $\rho_{M,C}$ is a graded right A -linear map; i.e.,

$$\rho_{M,C}(ma) = (|m_{-1}|/|m_0|)(|m_0|/|(m_{-1})^\alpha|)(m_{-1})^\alpha \otimes (m_0 a_\alpha).$$

We denote by ${}^{gr-C}\mathcal{M}(\psi)_{gr-A}$ the category of graded right-left (A, C, ψ) -entwined modules: its morphisms are the graded right A -linear maps and the graded left C -colinear maps.

3.3.1. Graded Doi-Hopf modules

In this section, H is a Hopf colour algebra with a bijective antipode S_H , A is a colour algebra and C is a graded coalgebra.

We say that A is a graded left H -comodule algebra if it is a graded left H -comodule via $\rho_{A,H}(a) = a_{[-1]} \otimes a_{[0]}$ such that $\rho_{A,H}(aa') = (|a_{[0]}|/|a'_{[-1]}|)(a_{[-1]} a'_{[-1]}) \otimes a_{[0]} \otimes a'_{[0]}$ and $\rho_{A,H}(1_A) = 1_H \otimes 1_A$. This is equivalent to say that the multiplication and the unit are graded left H -colinear, where the left H -coaction on $A \otimes A$ is defined by $(a \otimes a')_{[-1]} \otimes (a \otimes a')_{[0]} = (|a_{[0]}|/|a'_{[-1]}|)(a_{[-1]} a'_{[-1]}) \otimes a_{[0]} \otimes a'_{[0]}$.

We say that A is a graded right H -comodule algebra if it is a graded right H -comodule via $\rho_{A,H}(a) = a_{[0]} \otimes a_{[1]}$ such that $\rho_{A,H}(aa') = (|a_{[1]}|/|a'_{[0]}|)a_{[0]} \otimes a'_{[0]} \otimes (a_{[1]} a'_{[1]})$ and $\rho_{A,H}(1_A) = 1_A \otimes 1_H$. This is equivalent to say that the multiplication and the unit are graded right H -colinear, where the right H -coaction on $A \otimes A$ is defined by $(a \otimes a')_{[0]} \otimes (a \otimes a')_{[1]} = (|a_{[1]}|/|a'_{[0]}|)a_{[0]} \otimes a'_{[0]} \otimes (a_{[1]} a'_{[1]})$.

We say that C is a graded left H -module coalgebra if C is a graded left H -module such that $\Delta_C(h \rightharpoonup c) = (|h_2|/|c_1|)(h_1 \rightharpoonup c_1) \otimes (h_2 \rightharpoonup c_2)$ and $\epsilon_C(h \rightharpoonup c) = \epsilon_H(h)\epsilon_C(c)$. This is equivalent to say that Δ_C and ϵ_C are graded left H -linear, where the left H -action on $C \otimes C$ is defined by

$$h \rightharpoonup (c \otimes c') = (|h_2|/|c_1|)(h_1 \rightharpoonup c_1) \otimes (h_2 \rightharpoonup c_2).$$

We say that C is a graded right H -module coalgebra if C is a graded right H -module such that $\Delta_C(c \leftharpoonup h) = (|c_2|/|h_1|)(c_1 \leftharpoonup h_1) \otimes (c_2 \leftharpoonup h_2)$ and $\epsilon_C(c \leftharpoonup h) = \epsilon_H(h)\epsilon_C(c)$. This is equivalent to say that Δ_C and ϵ_C are graded right H -linear, where the right H -action on $C \otimes C$ is defined by

$$(c \otimes c') \leftharpoonup h = (|c_2|/|h_1|)(c_1 \leftharpoonup h_1) \otimes (c_2 \leftharpoonup h_2).$$

- Graded left-left Doi-Hopf modules.

Let A be a graded left H -comodule algebra and C a graded left H -module coalgebra. According to [5], we call the triple (H, A, C) a graded left-left Doi-Hopf datum.

The category ${}_{gr-A}^{gr-C}\mathcal{M}(H)$ of graded left-left Doi-Hopf modules is the category whose objects are the graded left A -modules and the graded left C -comodules M such that $\rho_{M,C}(am) = (|a_{[0]}|/|m_{-1}|)(a_{[-1]} \rightharpoonup m_{-1}) \otimes (a_{[0]}m_0)$. The morphisms of this category are the graded left A -linear maps and the graded left C -colinear maps. Any graded left-left Doi-Hopf datum (H, A, C) gives rise to a graded left-left entwining structure (A, C, ψ) : the map ψ is defined by $\psi(a \otimes c) = (|a_{[0]}|/|c|)(a_{[-1]} \rightharpoonup c) \otimes a_{[0]}$. The corresponding category of graded left-left entwined modules coincides with the category ${}_{gr-A}^{gr-C}\mathcal{M}(H)$.

- Graded right-right Doi-Hopf modules.

Let A be a graded right H -comodule algebra and C a graded right H -module coalgebra. According to [5], we call the triple (H, A, C) a graded right-right Doi-Hopf datum.

The category $\mathcal{M}(H)_{gr-A}^{gr-C}$ of graded right-right Doi-Hopf modules is the category whose objects are the graded right A -modules and the graded right C -comodules M such that $\rho_{M,C}(ma) = (|m_1|/|a_{[0]}|)(m_0a_{[0]}) \otimes (m_1 \leftharpoonup a_{[1]})$. The morphisms of this category are the graded right A -linear maps and the graded right C -colinear maps. Any graded right-right Doi-Hopf datum (H, A, C) gives rise to a graded right-right entwining structure (A, C, ψ) : the map ψ is defined by $\psi(c \otimes a) = (|c|/|a_{[0]}|)a_{[0]} \otimes (c \leftharpoonup a_{[1]})$. The corresponding category of graded right-right entwined modules coincides with $\mathcal{M}(H)_{gr-A}^{gr-C}$.

- Graded left-right Doi-Hopf modules.

Let A be a graded right H -comodule algebra and C a graded left H -module coalgebra. According to [5], we call the triple (H, A, C) a graded left-right Doi-Hopf datum.

The category ${}_{gr-A}\mathcal{M}(H)^{gr-C}$ of graded left-right Doi-Hopf modules is the category whose objects are the graded left A -modules and the graded right C -comodules M such that $\rho_{M,C}(am) = (|a_{[1]}|/|m_0|)(a_{[0]}m_0) \otimes (a_{[1]} \rightharpoonup m_1)$. The

morphisms of this category are the graded left A -linear maps and the graded right C -colinear maps. Any graded left-right Doi-Hopf datum (H, A, C) gives rise to a graded left-right entwining structure (A, C, ψ) : the map ψ is defined by $\psi(a \otimes c) = a_{[0]} \otimes (a_{[1]} \rightharpoonup c)$. The corresponding category of graded left-right entwined modules coincides with ${}_{gr-A}\mathcal{M}(H)^{gr-C}$.

- Graded right-left Doi-Hopf modules.

Let A be a graded left H -comodule algebra and C a graded right H -module coalgebra. According to [5], we call the triple (H, A, C) a graded right-left Doi-Hopf datum.

The category ${}^{gr-C}\mathcal{M}(H)_{gr-A}$ of graded right-left Doi-Hopf modules is the category whose objects are the graded right A -modules and the graded left C -comodules M such that $\rho_{M,C}(ma) = (|m_0|/|a_{[-1]}|)(m_{-1} \leftarrow a_{[-1]}) \otimes (m_0 a_{[0]})$. The morphisms of this category are the graded right A -linear maps and the graded left C -colinear maps. Any graded right-left Doi-Hopf datum (H, A, C) gives rise to a graded right-left entwining structure (A, C, ψ) : the map ψ is defined by $\psi(c \otimes a) = (c \leftarrow a_{[-1]}) \otimes a_{[0]}$. The corresponding category of graded right-left entwined modules coincides with ${}^{gr-C}\mathcal{M}(H)_{gr-A}$.
